

Q1: Can we Create a Nested Form in HTML ?

Answer: In HTML nesting forms means placing one <form> element inside another is not allowed, although, multiple forms can be possible to create. The HTML specification explicitly specifies that forms cannot be nested. Nesting forms can lead to unexpected behavior and conflicts between forms. As a result, web browsers do not support the nesting of forms.

Q2: How to use multiple submit buttons in an HTML form ?

Answer: Using multiple submit buttons in an HTML form allows different actions based on the button clicked. Each submit button can trigger a unique server-side or JavaScript process while sharing the same form fields, enabling various functionalities within a single form structure.

Q3: How can you create a form that doesn't have a submit button?

Answer: Use JavaScript to submit the form data; Instead of a submit button, you can use JavaScript to submit the form data to the server using an XMLHttpRequest object or the fetch API.
